#48171 - 9/7/23

Identification and Overview

Particulate Sensor, Duct – Air Quality

- Field Selectable Particulate Size of PM1.0, PM2.5 and PM10
- Field Selectable Outputs of 0 to 5V, 0 to 10V and 4 to 20mA
- Laser-based, light scattering particle sensing with 10 year expected lifetime.

The BBox Duct Particulate Sensor is an accurate and reliable way of continuously monitoring the concentration of particles in a duct. The duct unit samples duct air using an aspiration tube.

Laser-based sensors provide the highest accuracy for commercial applications and will measure particle concentrations from 0 to $1,000 \mu g/m3$.

Part #: N1-PM-D-BB-A

Specifications

Power: (Half-wave rectified)

7 to 40 VDC (4 to 20mA Output)

7 to 40 VDC or 12 to 28 VAC (0 to 5 VDC Output)

15 to 40 VDC or 15 to 28 VAC (0 to 10 VDC Output)

75 mA Max @ 24 VDC • 3 VA Max @ 24 VAC

Load Resistance: VDC Output 4K Ohms Min

Sensing Element: Laser-based, Light Scattering Sensor Element Life: 10 Years Typical

Concentration Range: 0 to 1,000 µg/m3

Accuracy at 77°F ±9°F (25°C ±5°C):

	0 to 100 µg/m ³	100 to 1,000 µg/m ³
PM1.0	±25 μg/m³	±25% of reading
PM2.5	±15 μg/m³	±15% of reading
PM10	±25 μg/m³	±25% of reading

Response Time: <6 Seconds

Wiring: 3 Wires, 16 to 22 AWG

Environmental Operating Range:

-4 to 158°F (-20 to 70°C)

0 to 95%RH Non-condensing

Enclosure Material:

UV-resistant Polycarbonate, UL94 V-0

Agency: CE EN 61326-1:2013 EMC, UL94 V-0, RoHS

Mounting

Mounting Template – Actual Size

Mounting

- 1. We recommend placing the sensor in the middle of the duct wall, away from stratified air, to achieve the best reading. The unit should also be a minimum of 3 duct diameters from an elbow, damper or other duct restriction.
- 2. Drill a 1" hole for the aspiration probe. Position the box so that airflow is directly into the holes on one side of the aspiration probe. There are no upstream or downstream holes, the air direction is not important.
- 3. Mount the enclosure to the duct using #10 screws (provided) through a minimum of two of the mounting feet on opposite corners. A 1/8' pilot screw hole in the duct makes mounting easier. Use the enclosure mounting feet to mark the pilot- hole locations.
- 4. Snug up the screws so that the foam backing is depressed to prevent air leakage but do not over-tighten or strip the threads.

#48171 - 9/7/23

- 5. Use the provided #6 screws to secure the cover for IP66 rating.
- 6. We recommend sealing the conduit opening with fiberglass insulation.

∵ ` Tip	Air needs to be moving towards holes in aspiration tube for optimal results.

Horizontal Mounting: Vertical mounting orientation shown here. For horizontal mounting, the aspiration tube can be twisted one-quarter turn counterclockwise from its snug position so that the air flow is into the holes in the aspiration tube. Do not twist farther than one-quarter turn.

Termination

Output Validation

- 1. A simple bump test is performed to validate that the sensor responds to elevated particulate levels.
- "Smoke in a can" type products, which are often used to test smoke detectors, are a good option for testing all 3
 particulate sizes. Cigarette smoke and incense smoke also work, but the particulate size may be too large to be
 measured on the PM1.0 setting.
- 3. Open the enclosure cover and spray the smoke in a can at the sensor for 1 to 2 seconds to flood it with smoke. After several seconds, the sensor's output will increase. It may take several minutes for the sensor's output to decrease to normal levels as the smoke dissipates.

Diagnostics

For the sensor to work correctly, the wiring entrance must remain air tight. If the Particulate Duct Sensor is mounted to a hollow wall and wired through its back, or wired with conduit, it is possible that a draft of clean air may fill the enclosure through the wiring opening. This draft may prevent the unit from measuring particulates. We recommend either a liquid-tight fitting or plugging the conduit at the enclosure.

Liquid-Tight Fitting – Liquid-Tight Fitting (BA/LTF) allows wire cables of 0.1 to 0.3 inch outside diameter to enter the box. Tightening the collar onto the wire cable keeps the wiring entrance air tight.

Conduit – Included with the Particulate Duct Sensor, is a foam plug to seal the $\frac{1}{2}$ inch EMT. Place the wires into the plug as shown and then insert the plug into

Figure 4: Wires Through Foam Plug

Diagnostics	
Possible Problems:	Possible Solutions:
General troubleshooting	 Determine that the input is set up correctly in the controller and BAS software. Check wiring at the sensor and controller for proper connections. Check for corrosion at either the controller or the sensor. Clean off the corrosion, restrip the interconnecting wire and reapply the connection. In extreme cases, replace the controller, interconnecting wire and/or sensor. Check the wiring between the sensor and controller. Label the terminals at the sensor end and the controller end. Disconnect the interconnecting wires from the controller and the sensor. With the wires disconnected, measure the resistance from wire-to-wire with a multimeter. The meter should read greater than 10 Meg-ohms, open or OL depending on the meter. Short the interconnecting wires together at one end. Go to the other end and measure the resistance from wire-to-wire with a multimeter. The meter should read less than 10 ohms with 22 gauge or larger wire a distance of 250 feet (76m) or less. If either test fails, replace the wire.
	Check power supply/controller voltage supply
	Disconnect sensor and check power wires for proper voltage.
Incorrect particulate output	Check all BAS controller software parameters.
Output alternates between	Check DIP switch S2. Only one of the three S2 switches can be set to "ON". 50% and 100% of setting.
